

Mohammed Alkindi

Computer Science student, UC San Diego

San Diego, CA | malkindi@ucsd.edu | github.com/MohammedAlkindi | linkedin.com/in/mohammed--alkindi | alkindix.com

EDUCATION

University of California, San Diego | B.S. Computer Science | IDEA Scholar

Expected Jun 2030

University of Pennsylvania | Non-degree program

Sep 2025 – Apr 2026

EXPERIENCE

Shell Kuwait | Data Analyst Intern

Jun 2026 – Aug 2026

- Automated the daily production report with a Python tool that turns the day's spreadsheets into dashboards, PDF reports and an email draft in about two minutes. The team did this by hand before.
- Added validation on every Excel input, so a bad source file stopped the run before any report went out.
- Built an interactive dashboard so colleagues could filter by asset, search wells and track performance.

OPEN SOURCE

Contributor to outside projects

Aug 2026 – Present

- Merged 164 pull requests across 43 projects as of October 2026 (39 at Microsoft), mostly correctness, Windows and CI bugs. Most active in simple-statistics (23), Microsoft hve-core (22) and NegPy (17).
- Fixed floating point cancellation in simple-statistics, where linear regression returned a slope 69% wrong when x was a timestamp. Centered the sums on the means and applied the same fix to Jenks variance.
- Corrected six standard normal table entries above $z = 2.9$ and two chi-squared critical values in simple-statistics, and gave tied values midranks in its rank correlation.
- Fixed a default optimizer rule in Microsoft onnxscript that ignored Gemm's beta when folding BatchNorm into Gemm, so rewritten models returned wrong values with no error. Added tests that fail without either half of the fix.
- Fixed a false deletion event in watchdog for Windows renames that change only letter case.

PROJECTS

ProofX | Python, Lean 4 | proofx.org

2024 – 2026 (paused)

- Built a Collatz counterexample search engine that ran about 10 million sequence steps per second and logged the seed, budget and code revision of every run, so any result can be replayed.
- Built Germinal, a Lean 4 pipeline that proposes and formalizes conjectures, then tests each one with three independent counterexample searches.

Ridge | JavaScript, Node.js, Claude API | ridge-data.vercel.app

2026

- Built a spreadsheet analysis app that computes correlations, Welch intervals, chi-square and Kolmogorov-Smirnov tests in code before any AI sees the data. Each finding records its method, sample size and source rows.
- Handled messy workbooks by detecting the header row and dropping title and total rows, with every excluded row reported. Tested with Vitest and Playwright in CI.

OmanX | JavaScript, Node.js, Supabase, Claude API | omanx.org

2026 – Present

- Built an AI guidance assistant for Omani scholarship students abroad. It answers visa questions from a curated knowledge base and government sites, and urgent cases get fixed checklists written in code.

HONORS

Mathematics Student of the Year, sole recipient (2025) | National mathematics competition, top 4 team (2024)

Thiel Fellowship Semifinalist (2026) | Oman National Scholarship (2025)

LEADERSHIP

- High school math teams**, founder and president at two schools. Ran their olympiad training.
- Oman Space**, co-founder (Aug 2026 – Present). Early stage group connecting Omani students with aerospace organizations.
- Penn Chess Club**, VP of Marketing (Sep 2025 – Apr 2026). Promoted club events and helped run them.

SKILLS

Languages: Python, TypeScript, JavaScript, SQL, Lean 4, Java (coursework)

Tools: Git, GitHub Actions, pytest, Vitest, Playwright, pandas, NumPy, scikit-learn, Node.js, React, PostgreSQL

Certifications: CS50x and CS50P (Harvard), Machine Learning Specialization (Stanford) | **Spoken:** Arabic and English
