

Mohammed Alkindi

Computer Science student, UC San Diego

San Diego, CA · malkindi@ucsd.edu · github.com/MohammedAlkindi · linkedin.com/in/mohammed--alkindi · alkindix.com

EDUCATION

University of California, San Diego | B.S. Computer Science

Sep 2026 – Present

- IDEA Scholar, Jacobs School of Engineering. Coursework: CSE 11 (Java), MATH 18 (Linear Algebra). Credit for MATH 20A and 20B (Calculus).

University of Pennsylvania | Non-degree program

Sep 2025 – Apr 2026

- VP of Marketing, Penn Chess Club.

EXPERIENCE

Shell Kuwait | Data Analyst Intern

Jun 2026 – Aug 2026

- Built a Python tool that turns the daily production spreadsheets into dashboards, PDF reports and an email draft in about two minutes. The team did this by hand before.
- Checked every Excel input before it reached a report, so a bad source file stopped the run instead of producing a wrong report.
- Built an interactive dashboard to filter by asset, search wells and track performance.

OPEN SOURCE

Contributor to outside projects

Aug 2026 – Present

- 164 merged pull requests across 43 projects as of October 2026, mostly Windows, CI and correctness bugs. Most active in simple-statistics (23), Microsoft hve-core (22), NegPy (17), watchdog (10) and NVIDIA Automodel (10).
- **Microsoft** (39 merged, most of them documentation and CI fixes in hve-core). In `apm`, package installs failed on Windows once staging paths passed 260 characters. Shortened the generated path segments and kept cleanup working for older installs.
- In Microsoft `onnxscript`, a default optimizer rule that folds BatchNorm into Gemm ignored Gemm's beta, so rewritten models returned wrong values with no error. Fixed the bias math and added tests that fail without either half of the fix.
- In `watchdog`, renaming `file` to `FILE` on Windows reported a false deletion. Traced it to the raw `ReadDirectoryChangesW` records and dropped the extra event.

PROJECTS

Ridge | JavaScript, Node.js, Claude API

2026

- Spreadsheet analysis tool that computes statistics, data quality checks and correlations before any AI sees the data. Each finding records its method, sample size, coverage and source rows.
- Reads messy workbooks: finds where the header starts, drops title and total rows, and reports every excluded row with the reason. An optional Claude layer explains the results afterward. Live at `ridge-data.vercel.app`.

OmanX | JavaScript, Supabase, Claude API

2026 – Present

- Guidance assistant for Omani scholarship students in the US, UK and Australia. Visa and scholarship questions are answered from a curated knowledge base and a search limited to government sites, with sources cited.
- Urgent cases, such as a terminated SEVIS record, get a fixed checklist written in code instead of by the model, so the steps are the same every time. Live at `omanx.org`.

ProofX | Python, Lean 4

2024 – 2026

- Counterexample search for number theory conjectures. Its Collatz engine ran about 10 million sequence steps per second and logged the seed, budget and code revision of every run so any result can be replayed.
- Germinal, its Lean 4 pipeline, proposes conjectures, formalizes them and runs three independent counterexample searches on each one. Paused. Details at `proofx.org`.

HONORS AND LEADERSHIP

- Thiel Fellowship Semifinalist (2026).
- Oman National Scholarship, Ministry of Higher Education (2025). Fully funded.
- Mathematics Student of the Year, high school (2025). Sole recipient.
- Oman Space, co-founder (2026 – Present). Connects Omani students with aerospace organizations.

SKILLS

Languages: Python, TypeScript, JavaScript, SQL, Java (coursework)

Tools: Git, GitHub Actions, pytest, Vitest, Playwright, pandas, NumPy, scikit-learn, Node.js, React, Next.js, PostgreSQL (Supabase)

Certifications: CS50x and CS50P (Harvard), Machine Learning Specialization (Stanford) · **Spoken:** Arabic and English
